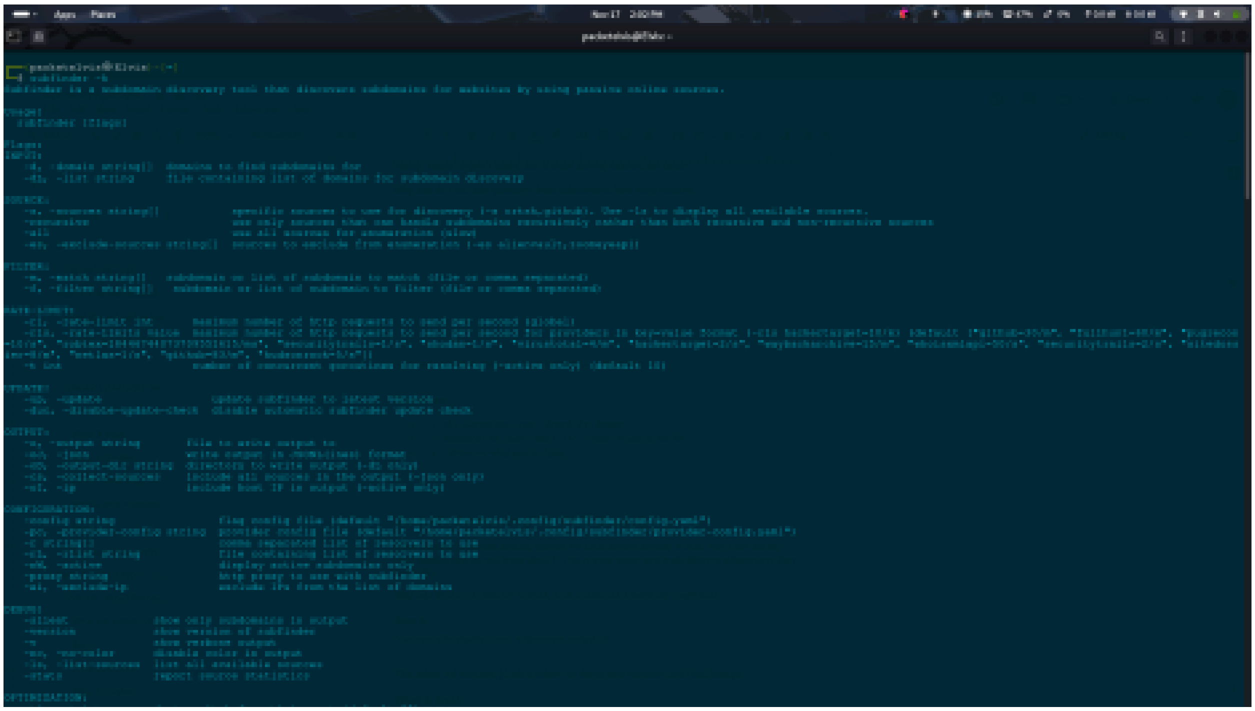
Tool #1: Subfinder (The Passive Detective)

What it does: Subfinder is like a detective who looks through public records - certificates, DNS history, search engine caches, etc. It never directly touches the server.

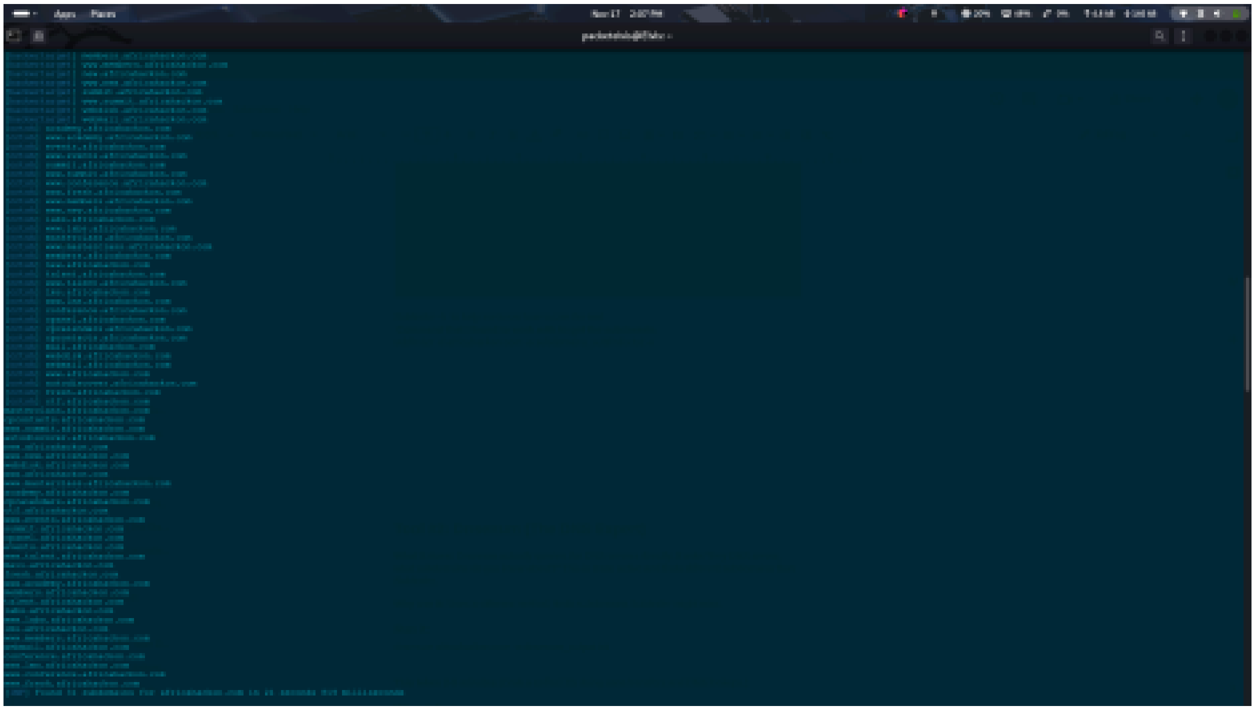
Why use it: Fast, safe (passive), finds subdomains from many sources.



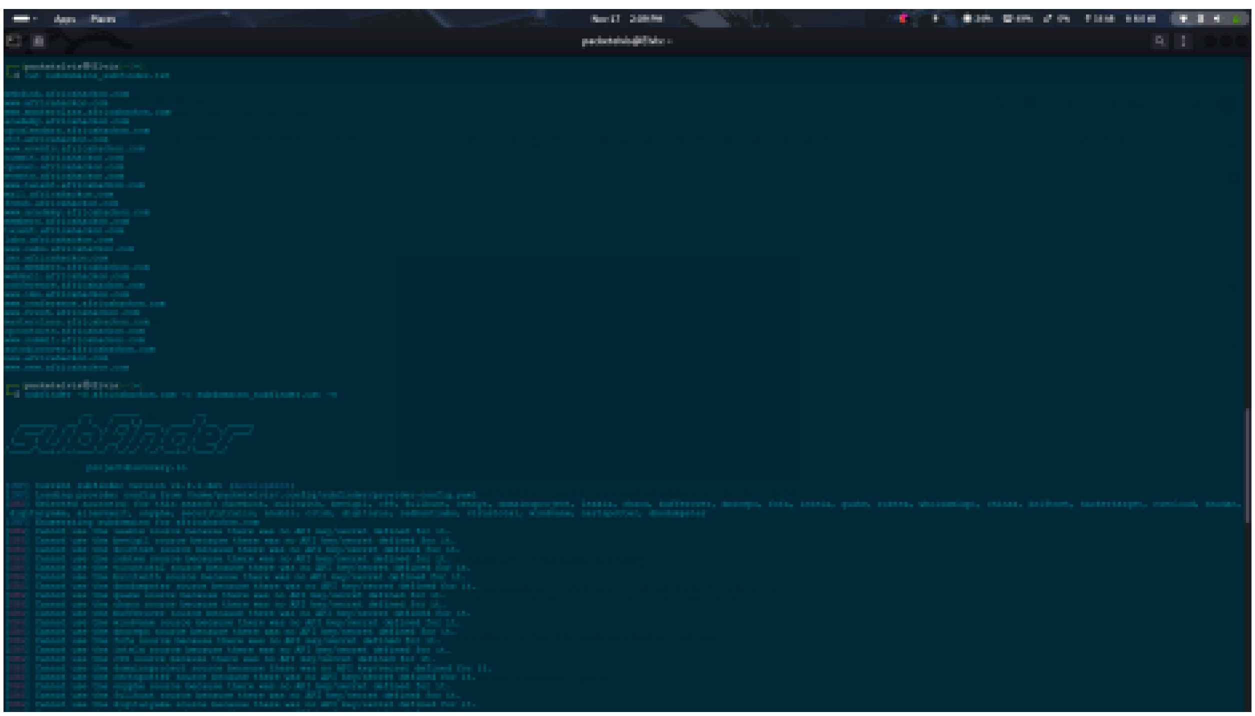
Subfinder -h to help me know how to use the tool

Command that i found to work with to get the subdomain

subfinder -d africahackon.com -o subdomains_subfinder.txt -v



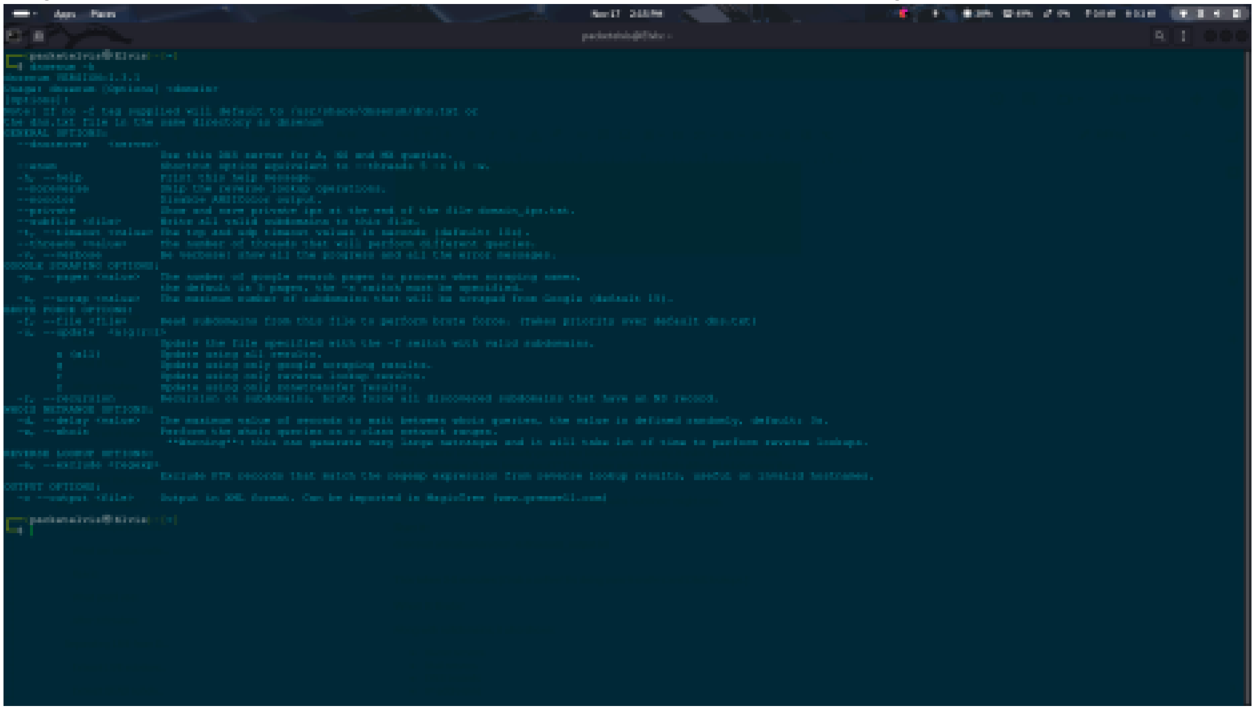
The subdomains i got to list them i used the command cat subdomains_subfinder.txt **to list the subdomain**



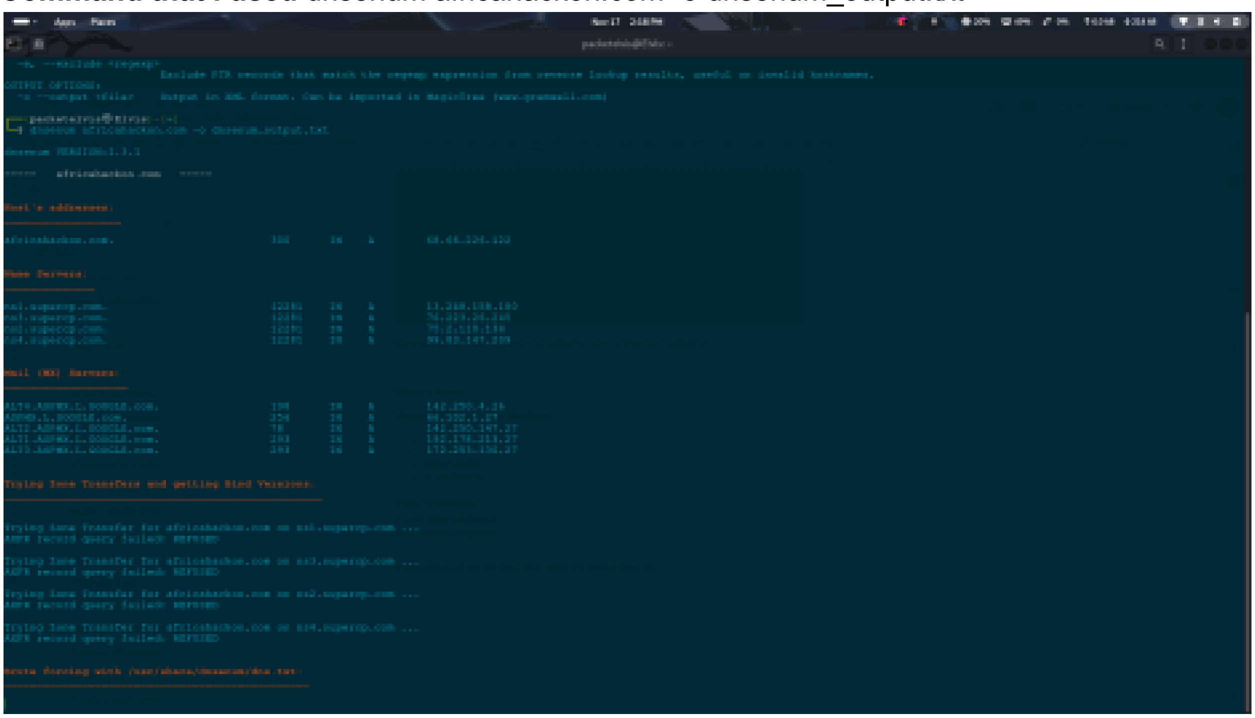
Tool 2: Dnsenum

What it does: Dnsenum actually queries the DNS servers directly. It asks what subdomains do you know about?" This is more active and finds different subdomains than Subfinder.

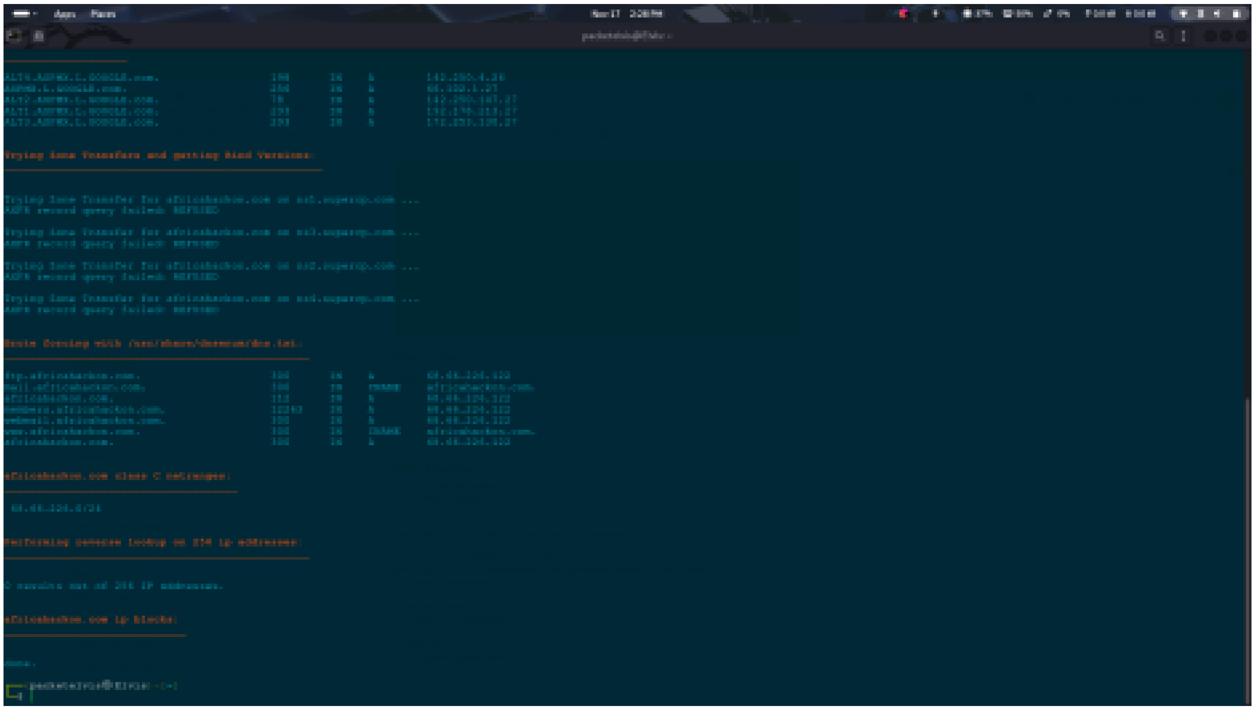
Why use it: Uses a different method, finds subdomains Subfinder might miss.



Command that i used dnsenum africahackon.com -o dnsenum_output.txt



What it finds:

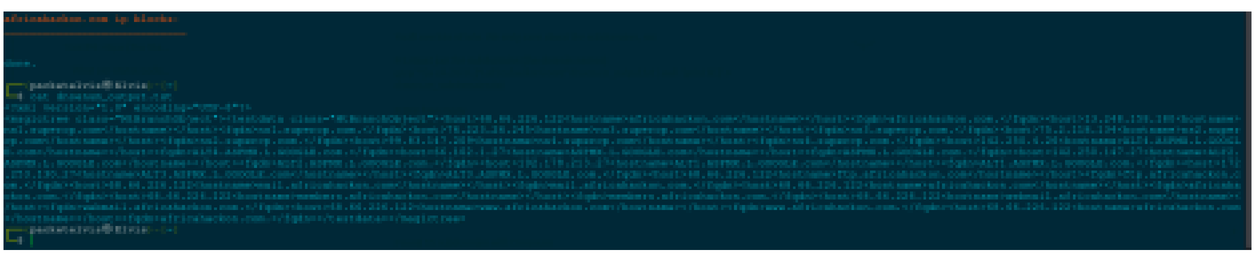


Along with subdomains, it also shows:

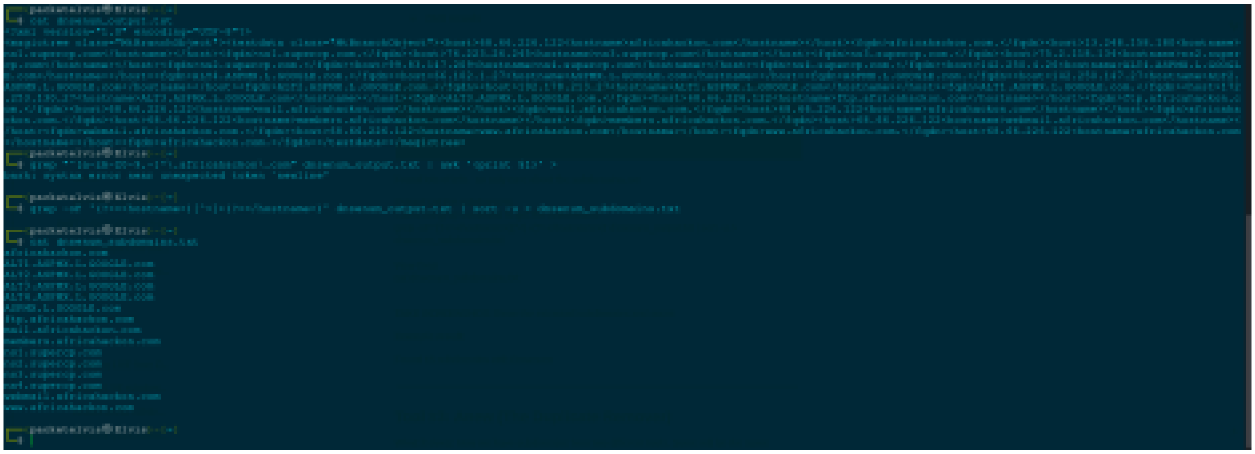
- Name servers
- Mail servers
- DNS records

After it finishes:

Look at the raw output
cat dnsenum_output.txt



Found lots of info. so only care about the subdomains, so:
Extract just the subdomains
I used the grep command to get the subdomains
grep -oP '(?<=<hostname>)[^<]+(?=</hostname>)' dnsenum_output.txt | sort -u > dnsenum_subdomains.txt
View them
cat dnsenum_subdomains.txt



Tool #3: Anew

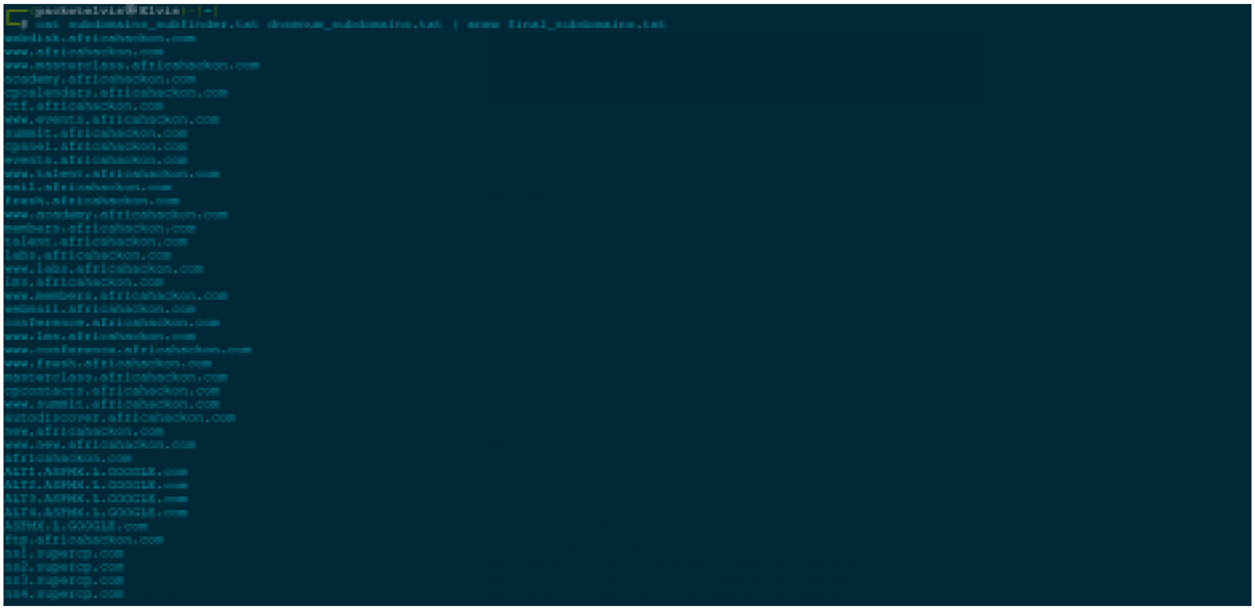
What it does: Now we have subdomains from two different tools. Some will be the same. Anew removes the duplicates and keeps only unique ones.

Why use it: Professional data cleaning. Shows you understand deduplication.

Here's what happens:

Before Anew:

After Anew:

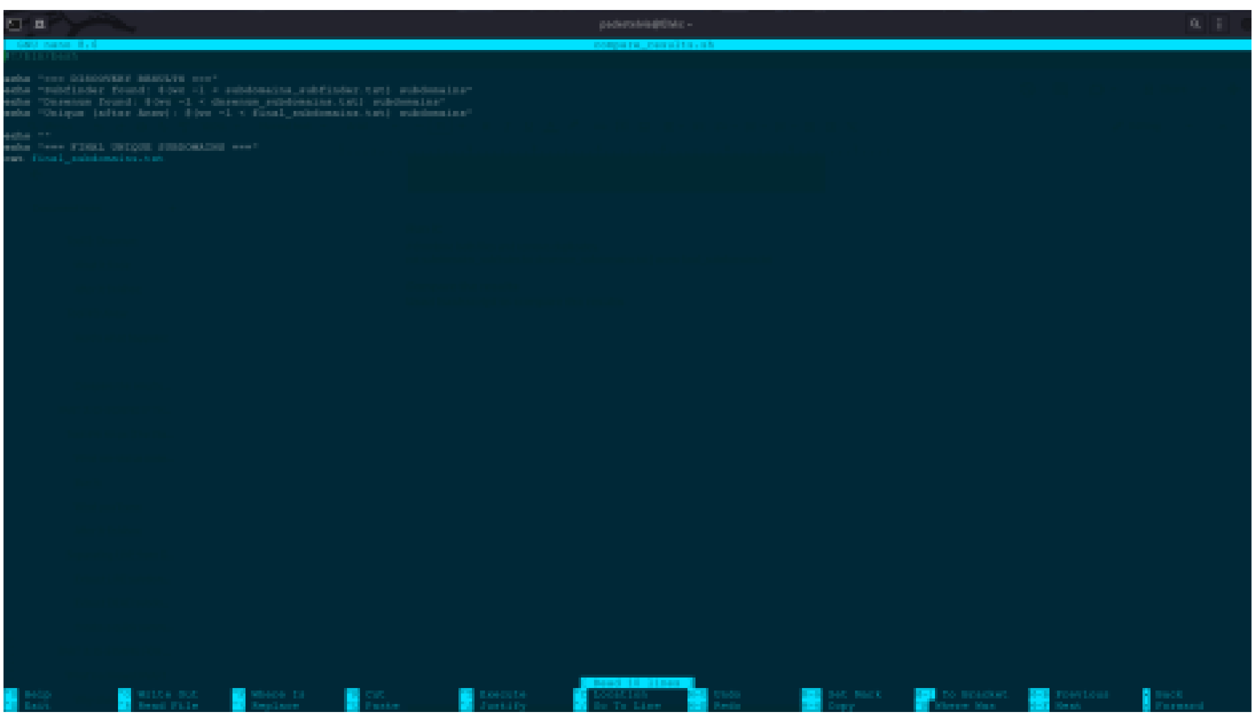


Run it:

Combine both files and remove duplicates
cat subdomains_subfinder.txt dnsenum_subdomains.txt | anew final_subdomains.txt

Compare the results

Used bashscript to compare the results



Subfinder found: 62
Dnsenum found: 15

Unique (after Anew): 42

This is the key part:

Out of everything both tools found, **42 subdomains were truly unique**.

PART 2: CHECKING IF THEY'RE ALIVE (The Verification)

Tool #4: Httpx to check their status ALive and dead subdomains

What it does: Httpx sends a request to each subdomain and checks: "Are you there? What status code do you send back?"

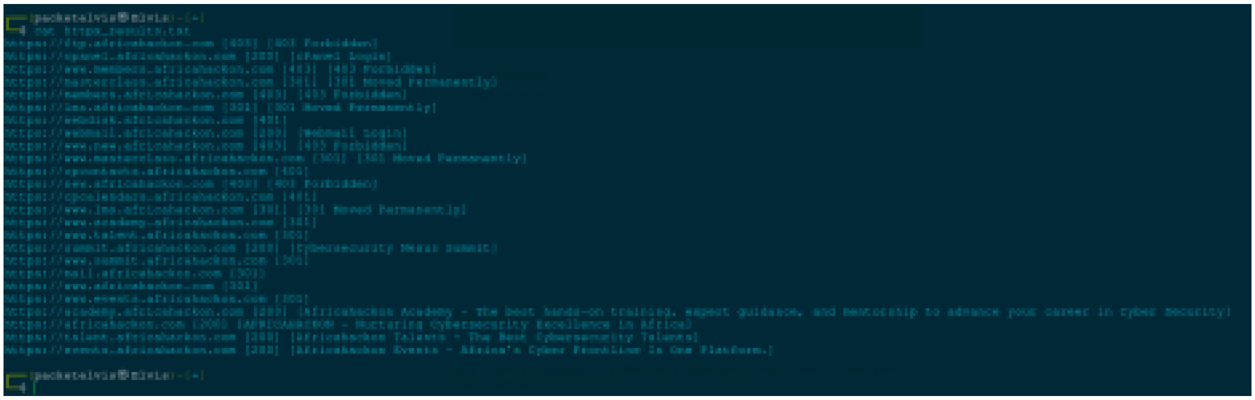
Why use it: Separates LIVE subdomains (servers responding) from DEAD ones (no response/offline).

Run it:

```
cat final_subdomains.txt | httpx -sc -title -o httpx_results.txt -v
```

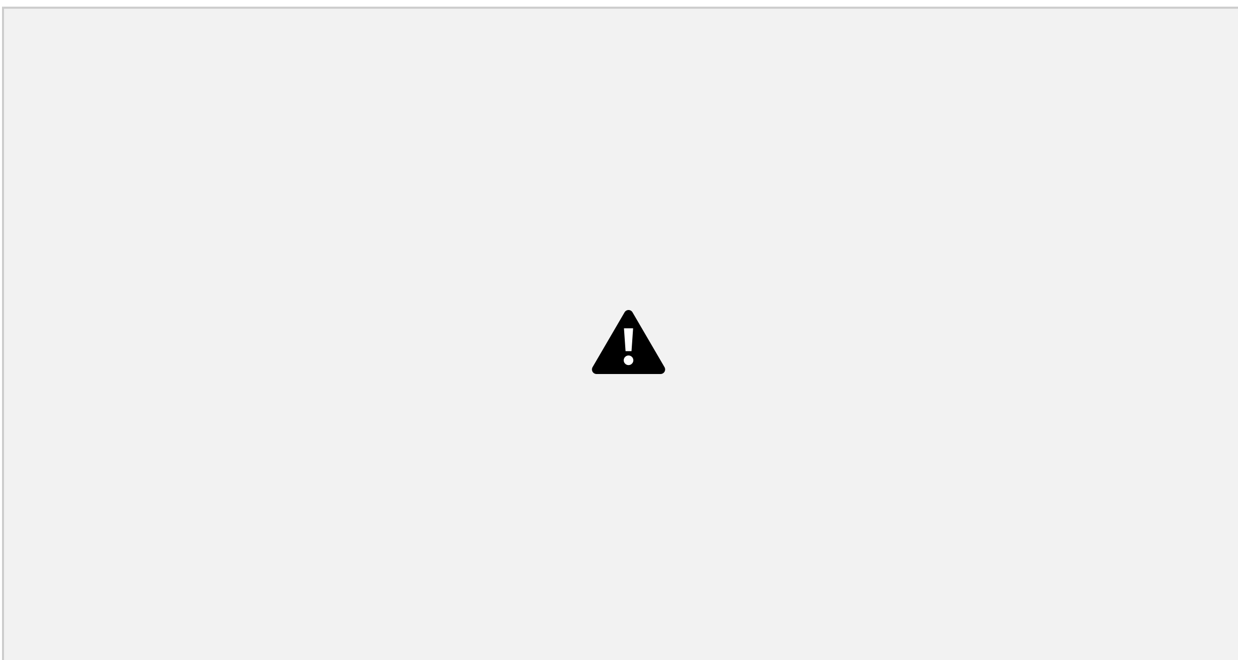
After it finishes:

```
cat httpx_results.txt
```

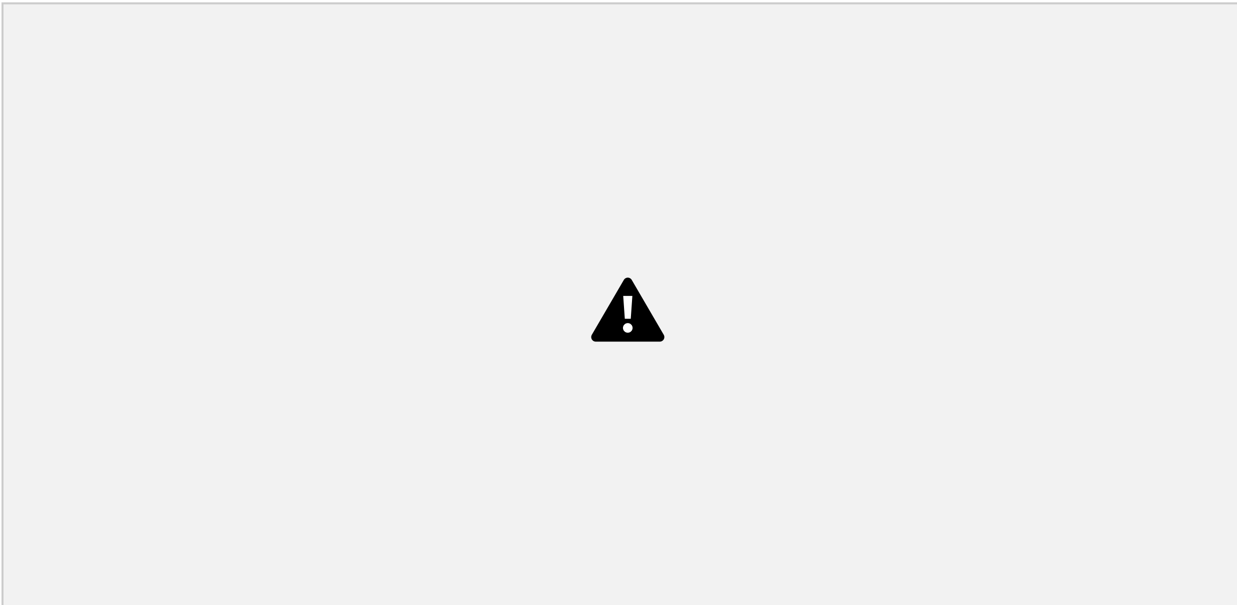


Separating LIVE from DEAD from the results of httpx_results.txt

I used the bash script to do the separation of the alive and the dead



Extract LIVE and dead subdomains

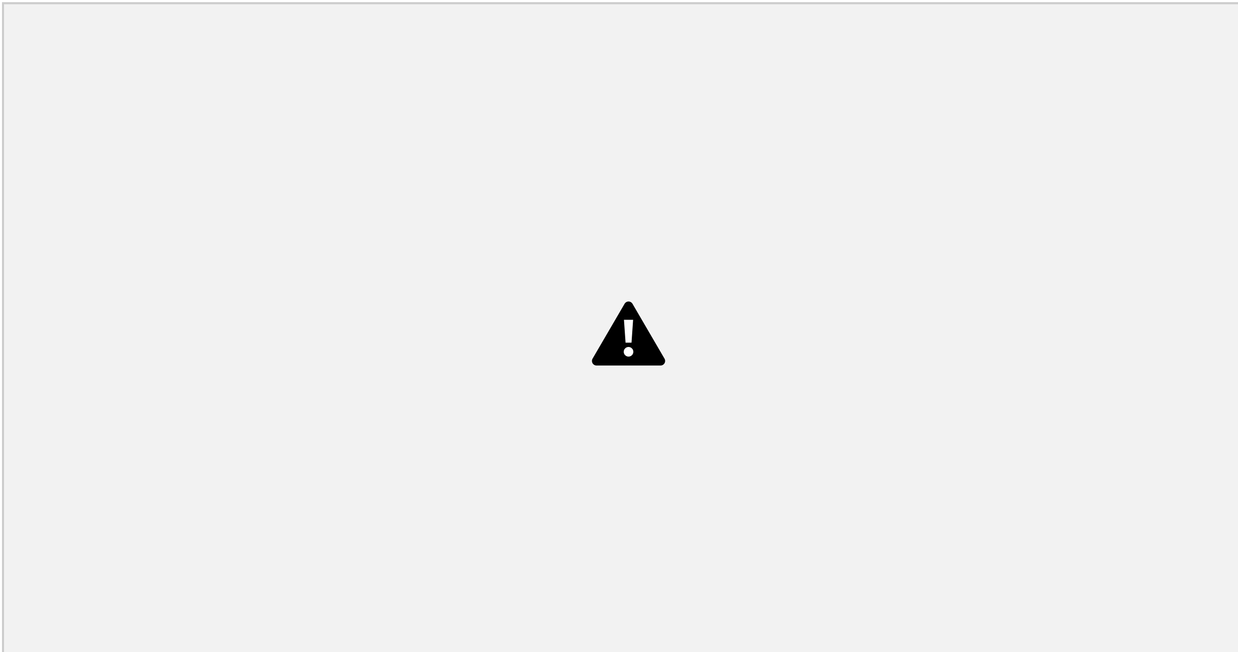


Found 25 alive subdomains and 0 dead subdomains

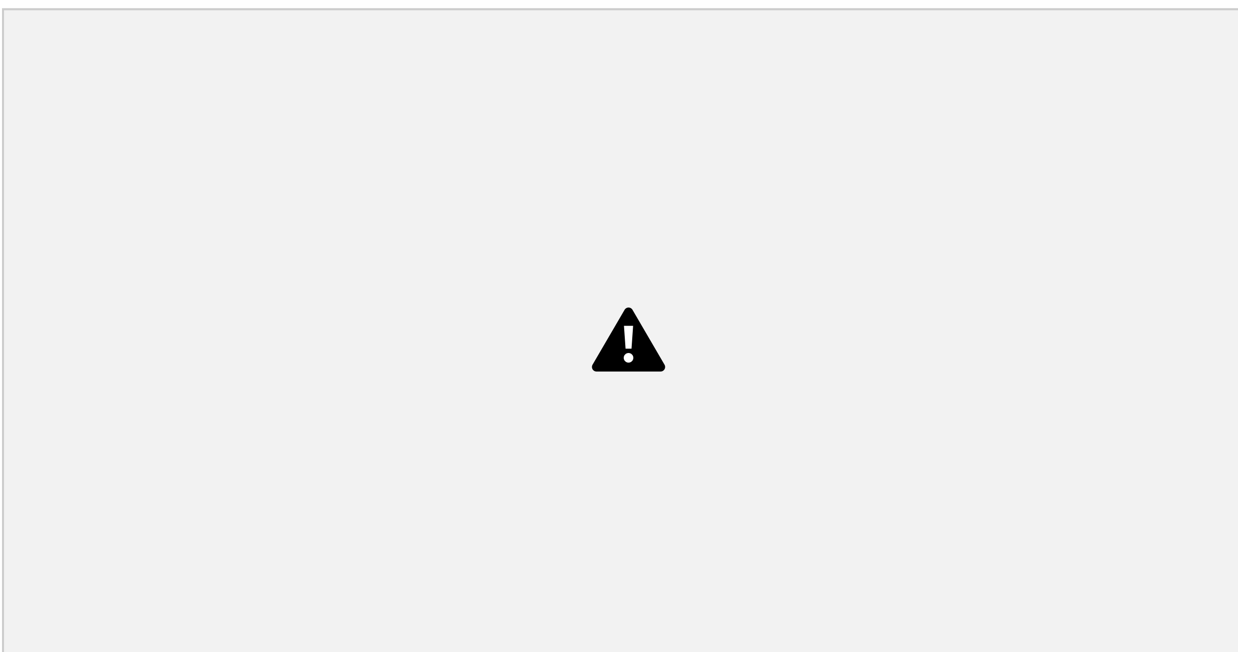
PART 3: CHECKING FOR FIREWALLS (The Security Analysis)

A **firewall/WAF (Web Application Firewall)** It checks every request and decides if it's safe.

We use Nuclei to scan
Tool 5 WAFwoof
Based on the alive subdomains



We are going to use the wafw00f to scan the alive subdomains that are there I used bashscript to do it since they were many



And this were the results of the WAF

```
┌──(packetelvis㉿Elvis)-[~]
└─$ cat waf_results.txt
